Adblock google chrome apk

With Google releasing a stable version of Chrome that supports extensions, it's a great time to install some of these enhancements to the web browser. Google says there are now 1500 extensions to choose from, which you can find and install here. To get you started, here are 10 of my favorites:RSS subscription extension: This extension displays an icon whenever you're on a page that can be subsumed into an RSS feed reader. SmoothScroll: Wanting you to swipe with Apple's multi-touch interfaces? SmoothScroll offers, with options for scrolling speed and frames per second. Works great with multi-touch track pads. Google Translation Bar: Next time some gadget blog links to a shady Japanese site, you can check it out yourself without visiting Google Translate directly. IE Tab: Not all sites care that Chrome is your favorite browser, and they will only run in Internet Explorer. For these occasions, IE Tab emulates Internet Explorer within Chrome. Tip: The extension doesn't have a Back button, but you can navigate by right-clicking. Instant Image Editor: Pixlr is my favorite cloud image editor - it's a lot like Photoshop, but for free - and Instant Image Editor opens photos online in Pixlr by holding Alt and right-clicking. Bit.ly: Click the Bit.ly and a window appears, containing a shortened link from the page you are on. I'm removing the appropriate site from my bookmarks. Google Mail Checker Plus: I prefer it more than the basic Gmail checker because it lets you view and manage new messages directly from the current browser window. There is no need to swap windows just to throw spam in the trash. Shareaholic: See a web page you like? Shareaholic allows you to explode on various social networking sites and aggregators, including Facebook, Twitter and Digg.Google Weather: And I'll be excluding Accuweather from my bookmarks as well. This extension brings a four-day forecast in predefined locations with one click, and provides links to Web sites if you want to go deeper. Nothing: This extension does nothing, writes developer Salmonella. It works as advertised. Good for a laugh, and nothing more. Note: When you buy something after clicking links in our articles, we can earn a small commission. Read our affiliate link policy for more details. Google Chrome is a free browser developed by Google, used to access web pages on the internet. As of May 2020, it is the most popular web browser of world choice, with over 60% of the web browser market share. Google Chrome is also a cross-platform browser, which means that there are versions that work on different computers, mobile devices, and operating systems. According to Statista, Google Chrome for Android is more used version, holding more than 32% of the global browser market as of February 2020. Using Google Chrome is as easy as using your current computer's default browser (such as Internet Explorer, Edge, or Safari). Whenever you you To visit a website, all you need to do is type the URL of the web address in the address bar at the top and tap Enter/Go/Search. Like other web browsers, Chrome includes basic browser features such as a back button, front button, refresh button, history, bookmarks, toolbar, and settings. Like other browsers, Chrome includes an anonymous mode that allows you to browse privately without having your history, cookies, or website data tracked. It also includes a large library of plugins and extensions. Chrome's range of extra features, however, goes far beyond the basics. Here are some of the best features in Google Chrome: It's fast, secure, and easy to use. Perhaps the biggest draw for Google Chrome is its raw performance. Web pages can be opened and loaded extremely quickly—even by browsing many pages with heavy graphics, ads, or video content. The interface is clean and simple to use, even for beginners, and updates are distributed frequently and automatically to keep security under control. You can use the address bar to search on Google. Do you need to look for something? Just open a new window or tab and start typing what you need to look for in the address bar. Then click Enter/Go/Search and you will be shown on the corresponding Google search results page. You can sync Chrome settings between devices. When you use Chrome with your Google Account, you can sync all your bookmarks, history, passwords, autofills, and more. This means that your settings will remain consistent and up-to-date whenever you use Chrome through your Google account on any other computer or device. Google Chrome extensions are available for many of your favorite web services, from Dropbox and Evernote to Pocket and Pinterest. They can be searched and downloaded from the Chrome Web Store. When you find an extension you want to use, just select Add to Chrome and then Add extension. A small pop-up box may appear in Chrome confirming the installation, along with a small note on how to access it. A new tab can be opened with more detailed instructions that show how to use all the features of the extension. To turn existing extensions on, off, or delete, select the three vertical dots in the upper-right corner of the Chrome browser. Then select More Tools > Extensions. Select the button switch on any extension to turn it on (blue) or off (gray). Select Remove to delete it. Google Chrome is completely free to download and use, but you'll need to use an existing web browser to download it. All you need to do is navigate to google.com/chrome and select the Download Chrome button. Google will automatically detect the platform you're on so it can provide the corresponding version of Chrome you need to download. If you're on a mobile device, a pop-up message appears to direct you to the iTunes App Store or Google Play Store, where you can download the Chrome app for iOS or Android. Google Chrome can be downloaded and used on the following platforms: macOS 10.10 or 8.1/10/8/7 32 bitWindows 10/8.1/8/7 64 bitWindows 10/8.1/8/7 32 bitLinuxAndroidiOS Google also offers frozen versions of Chrome for Windows XP, Windows Vista, macOS 10.6-10.9. This means that updates are not supported for these versions. Photo: Deepanker Verma (Pexels)A security flaw in Google Chrome was under active attack last week; although Google's latest update in Chrome (Hopefully) has automatically fixed the problem in your browser, it's important that you double-check if you're running the latest version (72.0.3626.121). But don't take our word for it. When you're leading Chrome's desktop and security engineering, suggesting that you update now —as at this point—it should take a few seconds to check your browser version. To start Chrome's built-in update tool, simply open your browser and select About Google Chrome, which you'll find in the Help section within your drop-down main menu. Your browser should then automatically update for you if there is a newer version to download. For more information about Lifehacker, be sure to follow us on Instagram @lifehackerdotcom. G/O Media can receive a commission Google has been slowly redesigning the logos of each of its products. Google had been a big fan of pseudo-3D with shadows and reflections of light and such, but has pushed itself for a smoother and more minimalist design for the past two years. One of the first major changes was the Chrome logo, and now Google is slightly changing its signature logo. And interestingly, the newly redesigned Google logo was found in the latest Chrome Beta for Android update. The changes are a bit subtle, the logo has simply been flattened and the colors have been lightened a bit. The different logo was also found on Google's servers, but unfortunately, they say the redesign won't replace the current Google logo anytime soon. According to a source in The Verge, the redesign was done for times when the beveled logo may not be displayed well—such as in printed banners or other corporate use cases. In fact, the redesigned logo has already been removed from the Chrome Beta APK. So even though we enjoyed the redesign, it looks like it won't replace the current design in the near future.source:Ars Technica via The Verge SUBSCRIBE TO OUR NEWSLETTER! Google updates Chrome regularly with new features, security updates, and more. Chrome downloads these updates and installs them automatically. But how often does this happen? It depends — it turns out that the Chrome upgrade process is quite complicated. Major stable versions Every six weeks Chrome is developed in the open and anyone can install the useless versions. But when it comes to the stable branch, the buildings are released approximately every six weeks. For example, the 73 was released on March 12, and Chrome 74 was released on April 23 —six weeks to the day. While it wasn't always the case -- originally Chrome updates were pretty sporadic -- the Chrome team committed to six-week release intervals in 2010 2010 has been relatively consistent ever since. Sometimes the releases come in four weeks, sometimes eight. But, generally speaking, it's always somewhere around the six-week mark. It's also worth noting that Google can adjust the stable release schedule around Chrome with no meeting weeks and holidays. Security fixes and bugs when needed While you can virtually rely on major version versions that come out regularly, bug fixes and security updates are much less predictable. Just scouring the stable version update changelogs shows that there have been three updates since Chrome 73 was released on March 12, and there is no discernible range between each version. This is pretty much par for the course for these types of updates. But at the very least, you can count on Chrome getting some bug fixes and/or security updates between major releases. Chrome will install major stable updates and minor updates automatically when they're available. You can always open the menu and go to help > about Google Chrome to check and install any updates immediately, too. When's the next update coming? If you're curious when the next major version of Chrome will be released to the stable channel, see the Chrome Platform Status website. This also shows when the current stable version has become stable, as well as information about the insatiable versions of Chrome being tested on the Beta and Dev channels. Chrome OS also updates every six weeks As the major browser versions, Chrome OS is updated approximately every six weeks. Although the numbers and features of the version usually mirror that of the browser counterpart, versions of Chrome OS usually happen a week after the browser update. So, for example, Chrome 73 was released on March 12, but Chrome OS 73 didn't fall on the stable channel until March 19. Otherwise, Chrome OS follows the same basic chrome OS browser release process. The main exception here is that the release schedule may vary depending on the specific chrome device—it may take a few weeks to reach some devices, as each of them is slightly different. How Chrome update channels work There are four branches of Chrome development: Canary, Dev, Beta, and Stable. These are in order from less stable (Canary) to more stable (one, stable). Eventually, the features that first appear in Canary should reach the stable channel—that's why many users who want to catch a glimpse of the future run multiple versions of Chrome on their computers. It's also really cool to see resources progress as they go through launch channels. Chrome Release Cycle Every six weeks, a Canary build is defined as the new branch of landmarks. This is where new features and enhancements are designed and implemented. It stays here for another two weeks, at which point it is pushed into the first beta. After two more weeks on the beta channel, a resource freeze is put in place —this means that all resources intended for the channel must be code-complete. This is also the reason why we see some features that were initially planned for a particular stable version are pushed back to the next big build. For the remaining four weeks of the beta phase, new builds are released weekly until stable release. On the Thursday before the stable version is pushed out (which usually happens on Tuesdays), the latest beta build becomes the release candidate. At this point, all stable characteristics are finished and merged with the stable branch. To test bug fixes, Google also has another build called Stable Update. This is a stable release that is off the regular release schedule and is used to fix critical issues that simply cannot wait. Stable releases Slowly Roll All stable versions of Chrome follow a release schedule in the stage (except for Linux, which is pushed to 100% at the time of release). Desktop versions -- Mac and Windows -- are released in four states: 5%, 15%, 50 percent, and 100 percent. That's why different users receive updates at different times. Android follows a similar schedule, albeit with an additional step: 1%, 5%, 15%, 50% and 100%. iOS follows a different pattern from the other two, with the update being released to all users over a seven-day period: Day 1: 1%; Day 2: 2%; Day 3: 5%; Day 4: 10%; Day 5: 20%, Day 6: 50%; and day 7: 100%. These staged releases allow Google to pick up issues before hitting all users, thereby stopping the release and resuming it as soon as the issue is fixed. Fixed.
